## LA5663V — Monolithic Linear IC Phase Control Voltage Inverter Control IC

### Overview

The LA5663V is Phase Control Voltage Inverter Control IC.

### Functions

- Phase control technique allows the voltage transformer to be driven at a frequency that provides excellent efficiency.
- The phase can be adjusted with an external resistor.
- Allows burst adjustment.
- Full complement of built-in protection circuits, including over-voltage protection and tube current detection and protection.
- High-precision reference voltage system. VREM precision:  $\pm 1\%$
- The on/off state of the VREM circuit can be controlled independent.

### Specifications

#### Maximum Ratings at $T_a = 25^\circ\text{C}$

Parameter	Symbol	Conditions	Ratings	Unit
Power supply voltage	$V_{CC}$		24	V
Maximum power drain allowed	$P_d \text{ max}$	Independent IC.	440	mW
Operating temperature range	$T_{opr}$		-30 to 85	$^\circ\text{C}$
Storage temperature range	$T_{stg}$		-55 to 150	$^\circ\text{C}$

#### Operating Conditions at $T_a = 25^\circ\text{C}$

Parameter	Symbol	Conditions	Ratings	Unit
Input voltage	$V_{CC}$		4.5 to 23	V
Oscillation frequency	$f_{osc}$		40 to 500	kHz
Burst drive frequency	$f_{PWM}$		50 to 1000	Hz
Output drive load capacity	CL1		0 to 1000	pF
	CL2		0 to 1000	pF

■ Any and all SANYO Semiconductor products described or contained herein do not have specifications that can handle applications that require extremely high levels of reliability, such as life-support systems, aircraft's control systems, or other applications whose failure can be reasonably expected to result in serious physical and/or material damage. Consult with your SANYO Semiconductor representative nearest you before using any SANYO Semiconductor products described or contained herein in such applications.

■ SANYO Semiconductor assumes no responsibility for equipment failures that result from using products at values that exceed, even momentarily, rated values (such as maximum ratings, operating condition ranges, or other parameters) listed in products specifications of any and all SANYO Semiconductor products described or contained herein.

## Pin Assignment

Block Diagram and Application Circuit Example

Pin Functions

Pin No.	Pin name	Function	Equivalent circuit
1	VREM	ON/OFF terminal of the IC.	
2	SGND	Signal Ground terminal.	
3	IFB	CCFL electric current waveform input terminal.	
4	DET_CR	Rectification (pulse way) waveform of CCFL output terminal.	
5	VLOOP_C	Error amplifier output terminal.	
6	RECT_C	Phase difference output terminal	
7	V_PHASE	Phase difference setup terminal

Pin No.	Pin name	Function	Equivalent circuit
20	DTC	Dead time setup terminal.	
21	C_OSC	Capacitor terminal for the VCO frequency setup.	
22	R_OSC	Resistance terminal for the VCO frequency setup.	
23	VREF	Standard voltage output terminal.	
24	VREG	Regulator voltage output terminal.	

Functional Descriptions

(1) IFB and DET\_CR pins

The IFB pin connects the CCFL current waveform detected by R10 to the Q4 base with bias VBE. The DET\_CR pin output level depends on both the Q4 base voltage less the VF component and the time constant determined by C4 and R2. These connections rectify the AC CCFL current waveform (VAC) for input to the negative side of the ERROR amplifier.

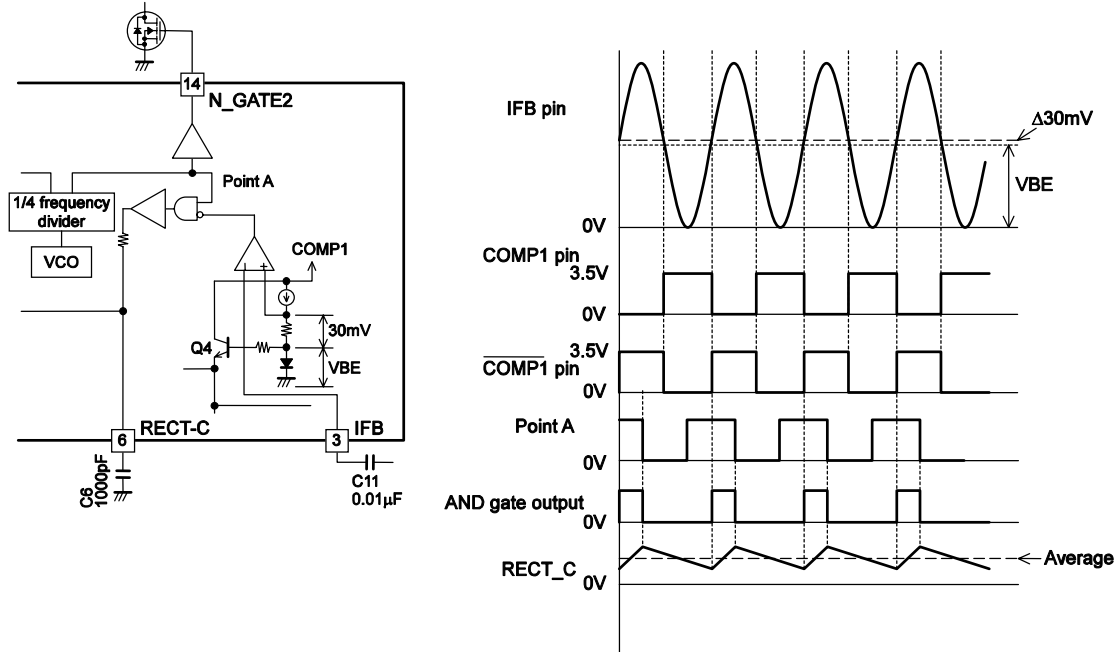

(2) VLOOP\_C and PGATE pins

The PWM waveform output from the P\_GATE pin is the result of the PWM1 amplifier comparing the VLOOP\_C voltage and the VCO triangular wave so that the rectified CCFL current waveform from the DET\_CR pin has the same potential (0.5V) as the positive side of the ERROR amplifier. This PWM control ensures that the CCFL current remains constant.

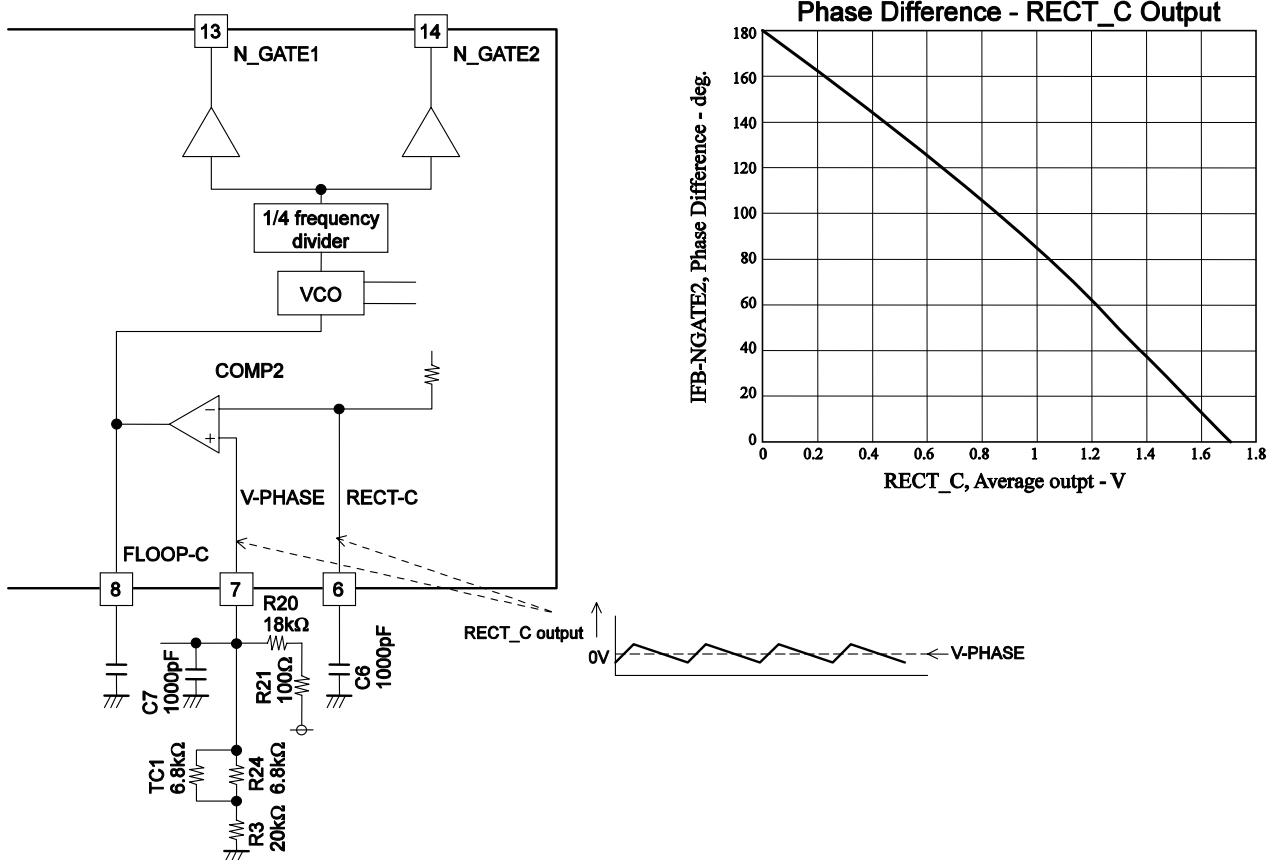

(3) RECT\_C pin

COMP1 rectifies the CCFL current waveform, plus bias VBE, from the IFB pin. ANDing this waveform voltage with that from point A (this latter has the same phase as NGATE2) averages the two, producing phase difference voltage output from the RECT\_C pin.

(4) V\_PHASE and FLOOP\_C pins

COMP2 controls the VCO frequency so that the RECT\_C and V\_PHASE pins have the same voltage. The RECT\_C pin voltage represents a phase difference voltage, so changing the V\_PHASE pin voltage adjusts the phase difference.

\* The above graph is based on measurements for the IC in isolation. Actual phase difference adjustment requires connection to the piezoelectric transformer.

## (5) C\_OSC and R\_OSC pins

These inputs determine the VCO oscillation frequency. Use R\_OSC to change the basic frequency.

## (6) C\_PWM, R\_PWM, and BRIGHT\_VR pins

These inputs determine the burst drive frequency. Use the BRIGHT\_VR pin voltage to change the burst width and R\_PWM to change the burst drive frequency.

\* The above graph is based on measurements for the independent IC.

# LA5663V

## (7) -VCON and DTC pins

The -VCON pin output voltage is inversely proportional to VCC. Using this output to create the DTC pin input voltage specifies a maximum duty dependent on VCC. On the other hand, connecting this output to the V\_PHASE pin input via the resistances R14 and R15 specifies a phase setting dependent on VCC. (Eliminate resistances R14 and R15 if such a VCC-dependent phase setting is not necessary.)

\* The Specifications stipulate OP1 output electrical characteristics for the -VCON pin.

$$-VCON = VREF \times \left(1 + \frac{R2A}{R1A}\right) - (VCC - V_{sat}) \times \left(\frac{R2A}{R1A}\right)$$

## LA5663V

### (8) N\_GATE1 and N\_GATE2 pins

These pins drive the n-channel MOSFET. The frequency is 1/4 the VCO frequency.

### (9) VREM pin

This input turns the IC on and off. Turning the IC off reduces the current drain to 5 $\mu$ A or less.

**(10) OVP**

This is the over-voltage detection terminal.

An OVP terminal gains a voltage that is divided by resistances. It works with threshold voltage 2V.

It becomes the condition of the table at the time of the movement.

Terminal	Condition
P_GATE	Hi
VLOOP_C	Low
FLOOP_C	Low
N_GATE1, 2	Drive

And once over-voltage protection works, it doesn't revert soon even if OVP is lower than 2V again.

It reverts after fixed time (the period of C\_PWM) passes.

**(11) SCP**

CCFL electric current decrease by the CCFL opening and so on. And a charge begins in the condenser connected to SCP when the voltage of DET\_CR was less than 0.26V.

Latch is set when the voltage of the condenser is more than 2V. The voltage of each terminal at this time becomes a table.

The charge of the condenser is stopped in the burst Duty again at the time of off period.

Terminal	Condition
P_GATE	Hi
VLOOP_C	Low
FLOOP_C	Low
N_GATE1, 2	Low

$$t_{scp} = 3.03 \times 10^6 \times C14 \times (100/\text{burst duty}) \text{ [S]}$$

Example:  $t_{scp} = 1 \text{ [S]}$   
 (At  $C14 = 0.33\mu\text{F}$ , burst duty = 100%)

**(12) The polarity of the piezoelectric transformer**

You must put logic with the transformer together, because a phase is controlled by comparing the common mode wave shape of N\_GATE2 with the common mode wave shape of CCFL electric current.

Connect a piezoelectric transformer so that each wave shape may become relations like a figure.

- Specifications of any and all SANYO Semiconductor products described or contained herein stipulate the performance, characteristics, and functions of the described products in the independent state, and are not guarantees of the performance, characteristics, and functions of the described products as mounted in the customer's products or equipment. To verify symptoms and states that cannot be evaluated in an independent device, the customer should always evaluate and test devices mounted in the customer's products or equipment.
- SANYO Semiconductor Co., Ltd. strives to supply high-quality high-reliability products. However, any and all semiconductor products fail with some probability. It is possible that these probabilistic failures could give rise to accidents or events that could endanger human lives, that could give rise to smoke or fire, or that could cause damage to other property. When designing equipment, adopt safety measures so that these kinds of accidents or events cannot occur. Such measures include but are not limited to protective circuits and error prevention circuits for safe design, redundant design, and structural design.
- In the event that any or all SANYO Semiconductor products (including technical data, services) described or contained herein are controlled under any of applicable local export control laws and regulations, such products must not be exported without obtaining the export license from the authorities concerned in accordance with the above law.
